Prepared By	Future Stars Baseball Club	Includes	Vincent's observations + key screenshots

Player Snapshot

Austin’s swing has strong potential. His lower half already shows good weight transfer and a good front-leg block. The priority is not a major lower-half rebuild. Instead, the most important fix is in the **hand setup and barrel starting angle**. Because the barrel begins tilted, the release tends to work around the body, which can create rollover contact and reduce barrel consistency.

Current Strengths	Priority Improvement Areas
• Good lower-half weight transfer. • Strong front-leg block that gives him a solid base. • Clear potential for better contact consistency with a small hand/barrel adjustment. • Good overall swing foundation rather than a complete rebuild.	• Neutralize the hand and barrel starting position. • Keep the bat path synced with the body. • Avoid rolling the hands over the ball too early. • Move contact slightly deeper instead of reaching too far in front of the center of mass.

Detailed Findings

1. Strong Lower-Half Foundation

Austin’s lower half is a real strength. He transfers weight well and uses a good front-leg block, which means he already has a stable base to create power.

2. Hand Setup and Barrel Tilt

The main issue is how the hands and barrel start. A tilted barrel at the start can make the barrel release around the body instead of staying connected to the swing path.

3. Rollover Pattern

Because the barrel releases around the body, Austin's hands tend to roll over the ball. This can make contact less consistent and can pull the barrel off the ideal path too early.

4. Bat Path Out of Sync

The tilted starting point causes the bat path to become slightly out of sync with the body. The body is in a good position, but the barrel is not always matching that movement.

5. Contact Too Far Forward

Austin's contact point is very far in front of his center of mass. This can lead to reaching, early rollover, and weaker barrel direction through the hitting zone.

Recommended Development Plan

- **Neutral Barrel Start Drill:** begin with the barrel in a more neutral and controlled position. Keep the hands relaxed and avoid starting with the barrel already tilted into a rollover path.
- **Connection Drill:** feel the hands, torso, and barrel working together instead of letting the barrel release around the body independently.
- **Deeper Contact Drill:** place the tee slightly deeper and work on hitting line drives through the middle, not rolling over balls out front.
- **Palm-Up / Palm-Down Contact Check:** at contact, the top hand should not roll over too early. Check that the barrel can stay through the ball.
- **Middle-Field Line Drive Drill:** use the middle of the field as the test. Better barrel direction should produce cleaner line-drive contact.

Integrated Notes From Vincent

Vincent's Original Observation

Austin's swing has great potential, his lower half making good weight transfers with a good front leg block. As for his hands, a small fix may greatly benefit his contact and barrel consistency. Because of the way Austin starts his hands, the barrel starts tilted which causes the barrel's release to be around the body. This is seen in the way his hands roll over the ball and around his body. The barrel's tilted starting point causes Austin's bat path to be out of sync with his body. In addition, his contact point is very far in front of his center of mass.

How Vincent's report fits the final evaluation

- Vincent correctly identified Austin's biggest strength: the lower half already works well, especially weight transfer and front-leg blocking.
- Vincent also identified the key mechanical issue: the hand setup creates a tilted barrel start, which affects release and barrel consistency.
- The phrase "bat path out of sync with his body" is important: it means the body may be moving well, but the barrel is not matching the body's movement pattern.
- The most important coaching priority is a small but precise hand/barrel fix, not a full swing rebuild.

Final Coaching Summary

Austin's development goal should be simple: **keep the strong lower half, clean up the hand/barrel start, stop the early rollover pattern, and move contact slightly deeper so the barrel can stay through the ball.**

Key Reference Screenshots

Setup / Hand Start: review the tilted barrel position and starting hand angle.

Move / Launch: check whether the barrel path stays synced with body movement.

Contact / Extension: review the very forward contact point and rollover tendency.

Use these screenshots together with the written report; they are reference frames extracted from Vincent's original Austin report.
