

Sean Hitting Video Analysis Report

Cleaned-up 3-page version integrating Vincent's written report and a more structured development plan.

Player	Sean	Report Type	Hitting Video Analysis
Prepared For	Future Stars Baseball Club	Format	English PDF Version

Overall Summary

Sean shows a solid athletic base and already has some useful lower-half energy transfer. The biggest opportunities for improvement are **bat path**, **distance to contact**, and **how his hips are used to produce force**. Right now, his barrel tends to drop behind the body, which causes the bat to spin around the ball instead of working out and through the ball. When that happens, contact quality becomes less consistent and it is harder to create efficient power.

Current Strengths ● Good intent in the swing and willingness to attack the ball. ● Lower half already shows some ability to transfer energy. ● Potential for more power once sequencing and bat path improve. ● Good foundation to build from rather than a complete rebuild.	Top Development Priorities ● Learn a more direct and repeatable bat path. ● Start at a more consistent distance from the tee or contact point. ● Land in a stronger, more stable hitting position. ● Use the hips more efficiently to create force from the ground up.
--	---

Key Mechanical Findings

- **Contact Setup:** Sean sometimes begins too far from the tee. That can force him to reach or miss, and it makes it harder to develop a reliable feel for the ideal contact point.
- **Landing Position:** He would benefit from landing in a stronger stance. A firmer front-side landing helps stabilize the swing so the bat can accelerate from a better base.
- **Bat Path:** The barrel drops behind the body. This creates a longer, less efficient path and often turns the swing into a rotational sweep around the ball.
- **Hip Usage:** Sean's lower half shows promise, but he is not yet using the hips as efficiently as he could. Better hip-driven force would improve power and swing direction.
- **Extension Through Contact:** The goal should be to move the barrel out and through the baseball rather than spinning around it.

Bottom line: Sean does not need a major overhaul. He needs a clearer contact setup, a cleaner barrel path, and stronger sequencing from the ground up.

Detailed Analysis

1. Distance From the Ball / Tee

Distance control is more important than many young hitters realize. If Sean starts too far away, the swing has to make compensations just to reach contact. That can lead to reaching, barrel drag, and misses. One of the fastest improvements he can make is learning to set up at a repeatable distance so he can consistently arrive at the best contact point.

2. Bat Path Efficiency

A productive swing sends the barrel to the ball on time and then continues through the hitting zone. Sean's current barrel pattern appears to drop behind him too much, which makes the path loopier and less direct. That forces more full-body rotation and reduces the feeling of staying through the ball.

3. Use of the Lower Half and Hips

Vincent correctly noted that Sean already transfers some lower-half energy well. The next step is to convert that athletic movement into better force production. Instead of letting the whole body spin together, Sean should learn to create force from the ground, stabilize the lower half, and let the hips help deliver the barrel more efficiently.

4. Stronger Landing and Balance

Landing in a stronger stance gives the hitter something to rotate against. A more stable landing helps the head stay quieter, the body stay centered, and the barrel arrive on plane more consistently. This is especially important if Sean wants both more power and better contact quality.

Recommended Training Plan

- **Drill 1 – Distance Check Drill:** Mark a repeatable stance distance from the tee. Start each rep from the same setup and build awareness of where ideal contact should occur.
- **Drill 2 – Short Bat Path / Direct Path Drill:** Use a simple cue such as “knob to the ball, barrel through the ball.” The focus is a cleaner route to contact without the barrel dropping excessively behind the body.
- **Drill 3 – Strong Landing Drill:** Pause briefly at foot strike. Check posture, head stability, and whether the body is stacked in a strong hitting position before the swing continues.
- **Drill 4 – Hip-Fire With Direction:** Practice rotating from the lower half while keeping the barrel working through the middle of the field. The goal is controlled rotation, not just spinning open.

Focus Area	What “Better” Looks Like
Setup Distance	Consistent stance and fewer reach-based misses
Bat Path	More direct path to the ball and better extension through contact
Landing Position	Stronger front side, quieter head, better balance
Hip Usage	More efficient force production without spinning around the ball

Suggested next step: after one to two weeks of focused drill work, record another short side-view and front/open-side video to compare changes in setup distance, bat path, and extension.

Vincent's Report + Integrated Notes

Vincent's Original Observation

"Sean would benefit from learning a proper bat path and landing with a strong stance that will provide power. Sean should learn to have a feel for where his point of contact is. I noticed that many times he started too far from the tee and it would cause misses. Sean does have a good lower half that transfers energy well, but would benefit from learning to use his hips to produce force. His barrel also drops behind his body and it forces him into a full body rotation that causes the bat to spin around the ball instead of out and through the ball."

How Vincent's report fits into the final evaluation

- Vincent correctly identified the **three most important priorities**: bat path, contact-point awareness, and stronger force production from the lower half.
- The clearest technical issue is the **barrel dropping behind the body**. This makes the swing too rotational and can reduce the hitter's ability to stay through the ball.
- The phrase "**spin around the ball instead of out and through the ball**" is a strong coaching observation. It captures the difference between a swing that only rotates and a swing that rotates with direction.
- Vincent also recognized an important positive: Sean already shows some useful lower-half transfer. That means the report is not only about weaknesses; it also points to an athletic foundation that can be developed.

Final Coaching Summary

Sean's development goal should be simple: **set up at a better distance, land stronger, clean up the bat path, and let the hips help deliver the barrel through the ball**. If those areas improve, Sean should see better contact quality, more repeatable swings, and more efficient power.

Note on screenshots/layout

This version is intentionally text-first so the page flow stays clean and avoids the large blank image spacing issue from the earlier report. If needed later, screenshots from the previously uploaded Sean video can be added on a final page only.
